

Division game is a 2-player game. In this game, there is a matrix of positive integers with N rows and M columns. Players make their moves in turns. In each step, the current player selects a row. If the row contains all 1s, the player looses. Otherwise, the player can select any number of integers (but at least 1 and each of them should be greater than 1 ) from that row and then divides each of the selected integers with any divisor other than 1 . For example, 6 can be divided by 2,3 and 6 , but cannot be divided by 1,4 and 5 . The player who first makes the matrix all 1 s wins. In other words, if in his/her move, player gets the matrix with all 1 s , then he/she looses. Given the matrix, your task is to determine whether the first player wins or not. Assume that both of the players will play perfectly to win.

## Input

The first line has a positive integer $\mathrm{T}, \mathrm{T}<=100,000$, denoting the number of test cases. This is followed by each test case per line.

Each test case starts with a line containing 2 integers N and M representing the number of rows and columns respectively. Both N and M are between 1 and 50 inclusive. Each of the next N line each contains M integers. All these integers are between 2 and 10000 inclusive.

## Output

For each test case, the output contains a line in the format Case \#x: M, where x is the case number (starting from 1 ) and M is "YES" when the first player has a winning strategy and "NO" otherwise.

Sample Input

| 5 |  |  |
| :--- | :--- | :--- | :--- |
| 2 | 2 |  |
| 2 | 3 |  |
| 2 | 3 |  |
| 2 | 2 |  |
| 4 | 9 |  |
| 8 | 5 |  |
| 3 | 3 |  |
| 2 | 3 | 5 |
| 3 | 9 | 2 |
| 8 | 8 | 3 |
| 3 | 3 |  |
| 3 | 4 | 5 |
| 4 | 5 | 6 |
| 5 | 6 | 7 |
| 2 | 3 |  |
| 4 | 5 | 6 |
| 7 | 8 | 9 |

Output for Sample Input

| Case \#1: | NO |
| :--- | :--- |
| Case \#2: NO |  |
| Case \#3: NO |  |
| Case \#4: YES |  |
| Case \#5: YES |  |
