G Non-negative Partial Sums

You are given a sequence of n numbers a_0, \ldots, a_{n-1} . A cyclic shift by k positions $(0 \le k \le n-1)$ results in the following sequence: $a_k, a_{k+1}, \ldots, a_{n-1}, a_0, a_1, \ldots, a_{k-1}$. How many of the n cyclic shifts satisfy the condition that the sum of the first *i* numbers is greater than or equal to zero for all *i* with $1 \le i \le n$?

Input

Each test case consists of two lines. The first contains the number n $(1 \le n \le 10^6)$, the number of integers in the sequence. The second contains n integers a_0, \ldots, a_{n-1} $(-1000 \le a_i \le 1000)$ representing the sequence of numbers. The input will finish with a line containing 0.

Output

For each test case, print one line with the number of cyclic shifts of the given sequence which satisfy the condition stated above.
