

Problem E

Eleven

In this problem, we refer to the digits of a positive integer as the sequence of digits required to write it in base 10 without leading zeros. For instance, the digits of $N = 2090$ are of course 2, 0, 9 and 0.

Let N be a positive integer. We call a positive integer M an eleven-multiple-anagram of N if and only if (1) the digits of M are a permutation of the digits of N , and (2) M is a multiple of 11. You are required to write a program that given N , calculates the number of its eleven-multiple-anagrams.

As an example, consider again $N = 2090$. The values that meet the first condition above are 2009, 2090, 2900, 9002, 9020 and 9200. Among those, only 2090 and 9020 satisfy the second condition, so the answer for $N = 2090$ is 2.

Input

A single line that contains an integer N ($1 \leq N \leq 10^{100}$).

Output

Output a line with an integer representing the number of eleven-multiple-anagrams of N . Because this number can be very large, you are required to output the remainder of dividing it by $10^9 + 7$.
