

C

Cool Word

Input: Standard Input
Output: Standard Output

A word is a string of lower-case letters. A cool word has at least 2 different letters and the number of occurrences of each different letter is different.

Here is a formal definition. Let w be a word and S be the set of letters in word w , then w is cool if and only if all $f(c)$ (for each character c in S) is all different. Here $f(c)$ means the number of occurrences of c in w .

For example, the word "ada" is cool because $f(a)=2$, $f(d)=1$, and they're different. "banana" is also cool because $f(a)=3$, $f(n)=2$, $f(b)=1$. But the word "bbacccd" is not cool because $f(a)=f(d)=1$. Some other interesting cool words include: mammal, needed, papaya, referee, senselessness.

Read a list of words and count the number of cool words.

Input

There will be at most 30 test cases. Each case begins with an integer n ($1 \leq n \leq 10000$), the number of words to check. Each of the following n lines contains a word containing at least one and at most 30 letters.

Output

For each test case, print the case number and the number of cool words.

Sample Input

```
2
ada
bbacccd
2
illness
a
```

Output for Sample Input

```
Case 1: 1
Case 2: 0
```
