## Tree Weights

A rooted tree with $\mathbf{N}$ nodes is given. Nodes are labeled 1 to $\mathbf{N}, 1$ being the root of the tree. Each of the leaves of this tree has a value assigned to it, which is zero at the beginning. The value for each internal node $\mathbf{U}$ is calculated as the sum of the values of all the nodes in the sub-tree rooted at $\mathbf{U}$. An internal node is a node, which has at least one child node.

You will be given two kinds of operations:
Type 1: given $\mathbf{U}$, find the value of node $\mathbf{U}$.
Type 2: given $\mathbf{U}$ and $\mathbf{X}$, increase the value of the leaf $\mathbf{U}$ with $\mathbf{X}$.

## Input

First line starts with $\mathbf{T}(0<\mathbf{T} \leq 10)$, number of test cases. Each of the case starts with $\mathbf{N}$ $\left(0<\mathbf{N} \leq 10^{\wedge} 5\right)$, number of nodes in the tree. Next there will be $\mathbf{N}-1$ lines each containing two integers $\mathbf{U}$ and $\mathbf{V}$, indicating an edge between $\mathbf{U}$ and $\mathbf{V}$. Next there will be $\mathbf{Q}\left(\mathbf{0}<\mathbf{Q} \leq 10^{\wedge} 5\right)$, number of operations. Next $\mathbf{Q}$ line will contain firstly TP (1 or 2 ), the type of the operation. Then based on the operation type, there will be one or two integers, $\mathbf{U}$ or $\mathbf{U}$ and $\mathbf{X}(1 \leq \mathbf{U} \leq \mathbf{N}$, $|\mathbf{X}| \leq 10^{\wedge} 9$ ). In case of $\mathbf{T P}=\mathbf{2}, \mathrm{U}$ will always be a leaf node.

## Output

For each case, print case number. Then for each operation of type 1, print the answer in a separate line. As value of the nodes can get huge, print the answer modulo $\mathbf{1 , 0 0 0 , 0 0 0 , 0 0 7}$. See sample I/O for more clarification.

|  | Sample Input | Output for Sample Input |
| :--- | :--- | :--- |
| 1 |  | Case 1: |
| 4 |  | 1 |
| 1 | 2 | 0 |
| 1 | 3 | 7 |
| 3 | 4 | 3 |
| 6 |  |  |
| 2 | 2 | 1 |
| 1 | 1 |  |
| 1 | 3 |  |
| 2 | 4 | 3 |
| 1 | 1 |  |
| 1 | 3 |  |
