## Problem A. Tangamandapio

```
Input: Standard
Output: Standard
Author(s): Sergio Corzo Cruz - Coderoad Bolivia
```

Tangamandapio's national competition is coming and it is time to write problems so all students are very excited to present their own problems.
$X$ likes subsequences and he wants to propose a problem about counting subsequences.
$Y$ loves permutations and he wants to propose a problem that requires knowing if a string has exactly $K$ different permutations.

Both of them think that their own problem is the best.
$Z$ is a friend of $X$ and $Y$, and he wants to finish the discussion so he proposes to create a problem that combines both problems in one.
Thus, they came with the following problem:
Given a string of text $S$ count the number of subsequence that have exactly $K$ different permutations.
A string $T$ is a subsequence of another string $S$, if deleting some elements from $S$ and without changing the order of the remaining elements, it is possible to get $T$.

## Input

There are multiple test cases. Each Test case contains two lines. The first line is a string $S\left(1 \leq|S| \leq 10^{3}\right)$ consisting of lowercase English alphabet. The second line contains an integer $K\left(1 \leq K \leq 10^{3}\right)$.

## Output

For each test case print exactly one line containing one integer representing the number of subsequences that have exactly $K$ different permutations modulo $10^{9}+9$.

## Example

| Input | Output |
| :--- | :--- |
| aaab | 3 |
| 3 | 5 |
| abcc |  |
| 2 |  |

Use fast I/O methods
