

Given a list of N numbers you will be allowed to choose any M of them. So you can choose in $\binom{N}{M}$ ways. You will have to determine how many of these chosen groups have a sum, which is divisible by D .

Input

The input file contains maximum ten sets of inputs. The description of each set is given below.

The first line of each set contains two integers N ($0 < N \leq 200$) and Q ($0 < Q \leq 10$). Here N indicates how many numbers are there and Q is the total no of query. Each of the next N lines contains one 32 bit signed integer. Our queries will have to be answered based on these N numbers. Next Q lines contain Q queries. Each query contains two integers D ($0 < D \leq 20$) and M ($0 < M \leq 10$) whose meanings are explained in the first paragraph.

Input is terminated by a case whose $N = 0$ and $Q = 0$. This case should not be processed.

Output

For each set of input, print the set number. Then for each query in the set print the query number followed by the number of desired groups. See sample output to know the exact output format.

Sample Input

```
10 2
1
2
3
4
5
6
7
8
9
10
5 1
5 2
5 1
2
3
4
5
6
6 2
0 0
```

Sample Output

```
SET 1:
QUERY 1: 2
QUERY 2: 9
SET 2:
QUERY 1: 1
```
