

## 11735 Corner the Queens

Corner the queen is a game played on  $n \times n$  chess like board with two players. The rows and columns are numbered from 0 to  $n - 1$ . Then a queen is placed on a random cell other than  $(0, 0)$ . Each player gives one move of the queen towards the cell  $(0, 0)$ . The move is like a chess queen. As you know a queen can move any number of cells horizontally, vertically or diagonally. In Formal a player can move a queen from cell  $(a_1, b_1)$  to cell  $(a_2, b_2)$  if  $(a_1 = a_2$  or  $b_1 = b_2$  or  $|a_1 - a_2| = |b_1 - b_2|)$ . Moreover in this game, move that takes queen away from the cell  $(0, 0)$  horizontally or vertically or diagonally is not allowed. Formally, if a player moves queen from cell  $(a_1, b_1)$  to  $(a_2, b_2)$  then  $(a_2 \leq a_1$  and  $b_2 \leq b_1)$  must be held. The player who first reaches the cell  $(0, 0)$  is the winner. Now you may already have guessed if both the players play optimally, the starting position determines the winner. For some cell like  $(2, 0)$  player 1 always wins and for some cell like  $(1, 2)$  player 2 always wins.

In this problem we consider an infinite chess board for playing the game. A rectangular region is specified. A cell from that region will be picked randomly as a starting position for the queen. All you have to find is the probability that player 1 wins assuming that both players will play optimally.

### Input

The first line of input will be a number  $T$  ( $T \leq 15000$ ) the number of test cases. Each of the following  $T$  lines will contain four integers  $x_1, y_1, x_2, y_2$  ( $0 \leq x_1 \leq x_2 \leq 1000000, 0 \leq y_1 \leq y_2 \leq 1000000$ ). Here  $(x_1, y_1)$  is the lower left and  $(x_2, y_2)$  is the upper right portion of the rectangle. The lowest-leftmost cell is  $(0, 0)$  and it is always outside the given rectangle.

### Output

For each line of input produce one line of output in the format 'Board  $X$ :  $n / d$ '. Here  $X$  is the number of case,  $n$  and  $d$  is the numerator and denominator of the probability expressed in reduced form. See the sample input and output for illustration.

### Sample Input

```
3
1 0 2 2
1 0 7 0
1 2 1 2
```

### Sample Output

```
Board 1: 2 / 3
Board 2: 1 / 1
Board 3: 0 / 1
```
