

## 12433 Rent a Car

The **ACM (Advanced Car Management) Rent a Car** company is very famous now-a-days because of their quality and service. Gaining popularity is not that easy as there are many competitor companies around. Each day they have a large number of car requests. Once a car is used for a day, if they want to use it later, they should send it for servicing. Actually it was their key theme for business and that's why they are so popular. There are  $C$  motor companies in town, where the  $k$ -th company has  $c_k$  cars in their showroom and price of a car of this company is  $p_k$ . There are  $R$  car service-centers in town, the  $i$ -th center takes  $d_i$  days and costs  $s_i$  per car service. Service centers can service huge number of cars at the same time. Now, ACM company has the request sheet for next  $N$  days, where in  $j$ -th day,  $r_j$  cars are needed. They want to fulfill all the requirements with minimized cost. Initially, ACM has empty garage. But their garage is huge and can store any number of cars.

### Input

The first line of input will contain  $T$  ( $\leq 100$ ) denoting the number of cases.

Each case starts with three integers  $N, C, R$  ( $1 \leq N, C, R \leq 50$ ). The next line contains  $N$  integers where the  $j$ -th integer denotes  $r_j$  ( $0 \leq r_j \leq 100$ ). The next line contains  $2C$  integers where the  $k$ -th integer-pair denotes  $c_k$  and  $p_k$  ( $1 \leq c_k, p_k \leq 100$ ). The next line contains  $2R$  integers where the  $i$ -th integer-pair denotes  $d_i$  and  $s_i$  ( $1 \leq d_i, s_i \leq 100$ ).

### Output

For each case, print the case number and the minimized cost to fulfill all the requests. If it's impossible to do so, print 'impossible'.

### Note

For case 1, 50 cars will be bought, 40 from company 1 (costs  $40 \cdot 90 = 3600$ ) and 10 from company 2 (costs  $10 \cdot 100 = 1000$ ). On day 1, 10 cars will be sent and then they will be sent to the service center (costs  $10 \cdot 5 = 50$ ). The cars will be received on day 3. On day 2, 20 cars will be sent. And on day 3, 20 unused cars will be sent along with the 10 cars (serviced). So, overall cost is  $3600 + 1000 + 50 = 4650$ .

### Sample Input

```
2
3 2 1
10 20 30
40 90 15 100
1 5
3 2 1
10 20 30
40 90 15 100
2 5
```

### Sample Output

```
Case 1: 4650
Case 2: impossible
```
