For any infinite-length decimal integer $S=d_{1} d_{2} d_{3} d_{4} \ldots\left(0 \leq d_{i} \leq 9, i \geq 1\right)$, let prefix $(S, p)$ be the integer formed by the first $p$ digits of $S$ (i.e. $d_{1} d_{2} d_{3} \ldots d_{p}$ ), and $F(S, i, p)$ be the percentage of digit $i$ in prefix $(S, p)$.

For example, if $S=122312231223 \ldots, F(S, 2,7)=\frac{4}{7} * 100$
We say $S$ is stable if and only if every for digit $i(0 \leq i \leq 9)$, there exists a real number $L(i)$ such that

$$
\lim _{p \rightarrow \infty} F(S, i, p)=L(i)
$$

Given three positive integers $M, X$ and $Y(0 \leq X \leq Y<M)$, and 10 pairs of integers $(A(0), B(0))$, $(A(1), B(1)), \ldots,(A(9), B(9))$, find an infinite stable integer $S$ such that:

1. Every $L(i)$ satisfies $A(i) \leq L(i) \leq B(i)$
2. For every integer $p \geq 1, X \leq(\operatorname{prefix}(S, p) \bmod M) \leq Y$.

If there are more than one solution, maximize the average value of all the digits in $S$. Since $S$ is stable, it can be proven that the average value converges.

For example, if $M=9, X=1$ and $Y=8, B(3)=B(4)=100$, all other $A(i)$ and $B(i)$ are zero, then the optimal $S$ is $44(4444443)^{*}$, where * means "repeated forever". It's not hard to see that prefix $(S, p)$ will never be a multiple of 9 , and $L(3)=\frac{1}{7} * 100, L(4)=\frac{6}{7} * 100$, all other $L(i)=0$.

## Input

There will be multiple test cases. Each test case contains 23 integers: $M, X, Y, A(0), A(1), \ldots, A(9)$, $B(0), B(1), \ldots, B(9) .2 \leq M \leq 50,0 \leq X \leq Y<M, 0 \leq A(i) \leq B(i) \leq 100$.

## Output

For each test case, print case number and the maximal average value rounded to 8 decimal places. If no infinite stable integer can be found, print ' NO SOLUTION' instead. Look at the output for sample input for details.

## Sample Input

| 2 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 20 | 20 | 20 | 20 | 20 | 20 | 20 | 20 | 20 | 20 |  |
