In number theory, a positive integer belongs to one and only one of the following categories: Deficient, Perfect or Abundant (DPA).

To decide the category of a positive integer $n$, first you have to calculate the sum of all its proper positive divisors. If the result is less than $n$ then $n$ is a deficient number, if the result is equal to $n$ then $n$ is a perfect number and if the result is greater than $n$ then $n$ is an abundant number. Remember that the proper divisors of $n$ don't include $n$ itself.

For example, the proper divisors of the number 8 are 1,2 and 4 which sum 7 . Since $7<8$ therefore 8 is a deficient number. The proper divisors of the number 6 are 1,2 and 3 which sum 6 . Since $6=6$ therefore 6 is a perfect number. The proper divisors of the number 18 are $1,2,3,6$ and 9 which sum 21. Since $21>18$ therefore 18 is an abundant number.

The task is to choose the category of a positive integer $n$ as a deficient, perfect or abundant number.

## Input

Input begins with an integer $t(1 \leq t \leq 500)$, the number of test cases, followed by $t$ lines, each line containing an integer $n\left(2 \leq n \leq 10^{3}\right)$.

## Output

For each test case, you should print a single line containing the word 'deficient', 'perfect' or 'abundant' that representing the category of the number $n$.

## Sample Input

## Sample Output

deficient
perfect
deficient
abundant
deficient
