

783 Trains

Two towns T1 and T2 are connected through a double railroad. The distance between T1 and T2 is d meters. From T1 to T2 the trains are leaving every t_1 seconds. From T2 to T1 the trains are leaving every t_2 seconds. The trains from T1 to T2 have a speed of v_1 m/s. The trains from T2 to T1 have a speed of v_2 m/s.

Your task is to write a program that computes the number of train “rendezvous” on the railroad which links T1 and T2, and which occur during the time interval $[0, t_f]$ seconds.

We consider that:

- at time 0 two trains are leaving (from T1 to T2, and from T2 to T1);
- the input and output data are integers.

Input

Your program reads data sets, one per line, in the following format:
 $d v_1 v_2 t_1 t_2 t_f$.

Output

The program writes to the output the number of “rendezvous”.

Sample Input

```
10 5 5 1 1 2
```

Sample Output

```
6
```
