Two towns T1 and T2 are connected through a double railroad. The distance between T1 and T2 is $d$ meters. From T1 to T2 the trains are leaving every $t_{1}$ seconds. From T2 to T1 the trains are leaving every $t_{2}$ seconds. The trains from T1 to T2 have a speed of $v_{1} \mathrm{~m} / \mathrm{s}$. The trains from T 2 to T 1 have a speed of $v_{2} \mathrm{~m} / \mathrm{s}$.

Your task is to write a program that computes the number of train "rendezvous" on the railroad which links T 1 and T 2 , and which occur during the time interval $\left[0, t_{f}\right]$ seconds.

We consider that:
a) at time 0 two trains are leaving (from T 1 to T 2 , and from T 2 to T 1 );
b) the input and output data are integers.

## Input

Your program reads data sets, one per line, in the following format:
$d v_{1} v_{2} t_{1} t_{2} t_{f}$.

## Output

The program writes to the output the number of "rendezvous".

## Sample Input

| 10 | 5 | 5 | 1 | 1 | 2 |
| :--- | :--- | :--- | :--- | :--- | :--- |

Sample Output
6
